

LOO-CV marginally prefers the adaptive fit ($\Delta \text{elpd} \approx 50 \pm 17$)
but Pareto-k diagnostics do not flag either fit; the data do not adjudicate.

- $\varepsilon = 1$ (scale neutrality)
- Fixed penalty (RW 0.05): $\varepsilon \approx 0.92$ (sub-unitary)
- Adaptive (HalfNormal): decline $\varepsilon \approx 1.22$ (super-unitary)
